DDDebug v1.0.8.758 for D5-D10.4 Sydney Retail

2025-02-13 22:53:57

DDDebug is an assortment of debugging tools that contains multiple modules: a memory profiler, a ribbon viewer, a module viewer, and an improved exception handler. DDDebug can be incorporated readily into your Delphi jobs, either with its integrated graphic user interface along with its own API.

The memory profiler traces memory allocations, recognizes the sort of allocation (if it's been done due to producing an item, string, array, or document), and provides up to date information regarding memory usage and data. Unlike other options, it will support bundles, independent of any particular compiler switches, and instant responses.

DDDebug Great Attributes:

- Recognizes strings, objects, arrays, and documents
- Supports bundles
- Supports profiling of numerous threads
- Call heap recovery
- Employs standard MAP documents
- independent of compiler switches
- Incorporated GUI for debugging and monitoring
- Simple to use; virtually no particular requirements
- Service for wait series traversal
- Discovery of thread deadlocks
- Discovery of prematurely freed memory
