

Pranas.NET SQLBackupAndFTP Professional v12.7.19

2025-01-01 21:40:12

The SQL Backup and FTP is described to be a stand-alone application and the user by the license never expires and the user can use the version that he has purchased forever. It has a subscription which is an option and requires an annual recurring fee from the users and the developer. This particular subscription permits the user to auto-update the apps in order to get the latest versions and even to see the backup history which is on the web. It permits the user to receive direct email support from the team that can send the backup notification and configure the user mail server. The user can receive alerts whenever the server, as well as the backup service, is down. The SQL Backup and FTP can schedule jobs to backup to use SQL Server databases which can be full, differential, and even transaction log. Zipping as well as encrypting the backups, zipping as well as encrypting the file folders and even the backup to a remote server of the FTP translator saving it on the LAN. It has the ability to send the user an email confirmation as well as to execute the custom scripts of SQL before and after the backup process. It permits the user and the developer to back up the database within 2 minutes and it promises no more configuration complication for the user and can run the transaction log backup as well as the differential in order to provide a full back up in all the editions for the users.

Pranas.NET SQLBackupAndFTP Great Features:

It has the following features that are stated below such as:

- It has the ability to backup an unlimited number of databases with the use of the run now button without even having to schedule.
- It can send a confirmation email on the success or failure of the job.
- It can restore the backup with the use of a single click with the backup change automatically and restore all of them in a correct sequence.
- It has the ability to backup files and folders.
- The encryption process for the AES can take place.

The SQL Backup and FTP is basically a software which is capable of backing up the server of SQL, MySQL, along with the database of the PostgreSQL what do users and developers. It has been able to perform a regular as well as full and at the same time at the differential and transactional log backing it can either run a file or a folder backup and even can zip and encrypt the backup and later save and stored them on the network or the server of the FTP or even in the Cloud for the users and the developers. It has the ability to remove the backups that are old and also to send an email confirmation on the success or the failure of the job to the user.

The SQL Backup and FTP is known to be very ideal for any of the SQL servers, MySQL, Azure SQL, PostgreSQL, and even the database of the Amazon RDS SQL where the backups can be sent to the network folder of the FTP, SFTP, FTPS, NAS, Google Drive, One drive, Azure storage, Back blaze B2, and finally the Yandex. It is very much useful to further SQL Server versions that include the Azure SQL as well as the Amazon RDS SQL, MySQL, Maria DB, since they do not have to be created on the built-in tools for the process of backup by the users and developers.

It should be added that the SQL Backup and FTP have been designed and made in a way to be simple for the users and developers. The majority of the users consider this to be a huge advantage and some specific configuration processes are not being handled. The user should not utilize the SQL Backup and FTP if he desires to monitor the SQL Server performance as well as the schedule backups online in the user browser for a huge number of servers and it may be suited better for the user and the developer.
