Silent Install Builder v6.4.0

2026-04-08 08:41:11

Silent Install Builder is an application that can save time and effort for IT teams when deploying software to the whole company. You can no longer install and update programs individually, but instead can easily generate intelligent packages that can be used to deploy with tools such as GPO, SCCM, Intune, and other enterprise deployment tools. This renders installations at scale austere and uniform.

Silent Install Builder, with its inbuilt automation features, can record your installation procedure of one program and then it can repeat the procedure without a user click on each computer. It can even execute scripts, auto-detect installer settings, and even install more than one application at a time. This gives you the flexibility to deal with simple app rollouts to more advanced deployment situations.

In addition to installations, **Silent Install Builder** also assists you in managing the software life cycles, uninstalling software, performing system checks, and making alterations to files or registries. Wrapping software in .EXE or .MSI files will ensure you are assured of deployments ready to be integrated within an enterprise, and at the same time, simple to incorporate with the current IT workflow.

Key Features of **Silent Install Builder**:

1. **UI Automation Scripting** – Record an installation process once and replay it silently on multiple systems.
2. **Command Execution** – Run PowerShell, CMD, VBS, or other scripts during deployment.
3. **Multi-App Installation** – Deploy multiple applications at the same time with a single package.
4. **Installer Detection** – Automatically identify installer type and command-line options for popular setups.
5. **Advanced Scripting** – Use JavaScript and .NET APIs to define conditions, edit files, and update registry entries.
6. **Smart Conditions** – Ensure installs only run when specific system requirements are met.
7. **Application Uninstaller** – Remove programs based on name and version rules.
8. **Enterprise-Ready Packages** – Build EXE or MSI packages optimized for GPO, SCCM, Intune, and other deployment tools.
