  LazerCut can be found in the KeyHydra program from Onikanabo. It offers an interactive boolean process inside 3Ds Max using the tools to manipulate objects that every user is familiar with use, without having to access subobjects or implement Booleans. Add certain circles, rectangles, manifolds, and manifolds or create your own Splines, and it will subtract and split them, then add or solidify them for you.
- CONTROL MODELING SETTINGS WITH YOUR MOUSE WHEEL.
  The Ctrl wheel lets users adjust any model set using the wheel. It can control anything from the amount of segmentation on the primitive to the number of connections to the number of pins used, the extrusion settings, and more! It is more difficult to concentrate on your task.
