ASP.Net　　.Net

Components

RapidSpell Web integrates automatically into internet applications with minimal quantities of Javascript - allowing it to operate readily with any page rendering technologies (like ASP.NET, MVC, AJAX, Razor, or only plain HTML documents). RapidSpell also comprises traditional ASP.NET server controls that could be used rather than the Javascript system, to manually set up the spell check. The UI provides all of the typical attributes, add, change, change all, ignore, ignore all of the choices, and intelligent tips.

RapidSpell Web ASP.NET permits developers to add a strong as-you-type, inline, or conversation ASP.NET spell checker into any internet application.

RapidSpell Web integrates automatically into internet applications with minimal quantities of Javascript - that allows it to operate readily with any page rendering technology (like ASP.NET, MVC, AJAX, Razor, or only plain HTML documents). RapidSpell also comprises traditional ASP.NET server controls that could be used rather than the Javascript system, to manually set up the spell check. The UI provides all of the typical attributes, add, change, change all, ignore, ignore all of the choices, and intelligent tips. It interactively checks ASP.NET text controllers, any HTML text component for example"textarea" and"input" along with 3rd party elements. The spell checker UI comes with a sophisticated preview widget to interactively highlight mistakes (with no postback). The spell checker takes manual alterations and additionally supports user dictionaries (possibly 1 dictionary for many users or different user dictionaries). The added non GUI part offers core spell checker performance in the middleware level, so it is acceptable for server applications in addition to any console program.
